

PRACTICAL: ORAL CAVITY IN HEALTH

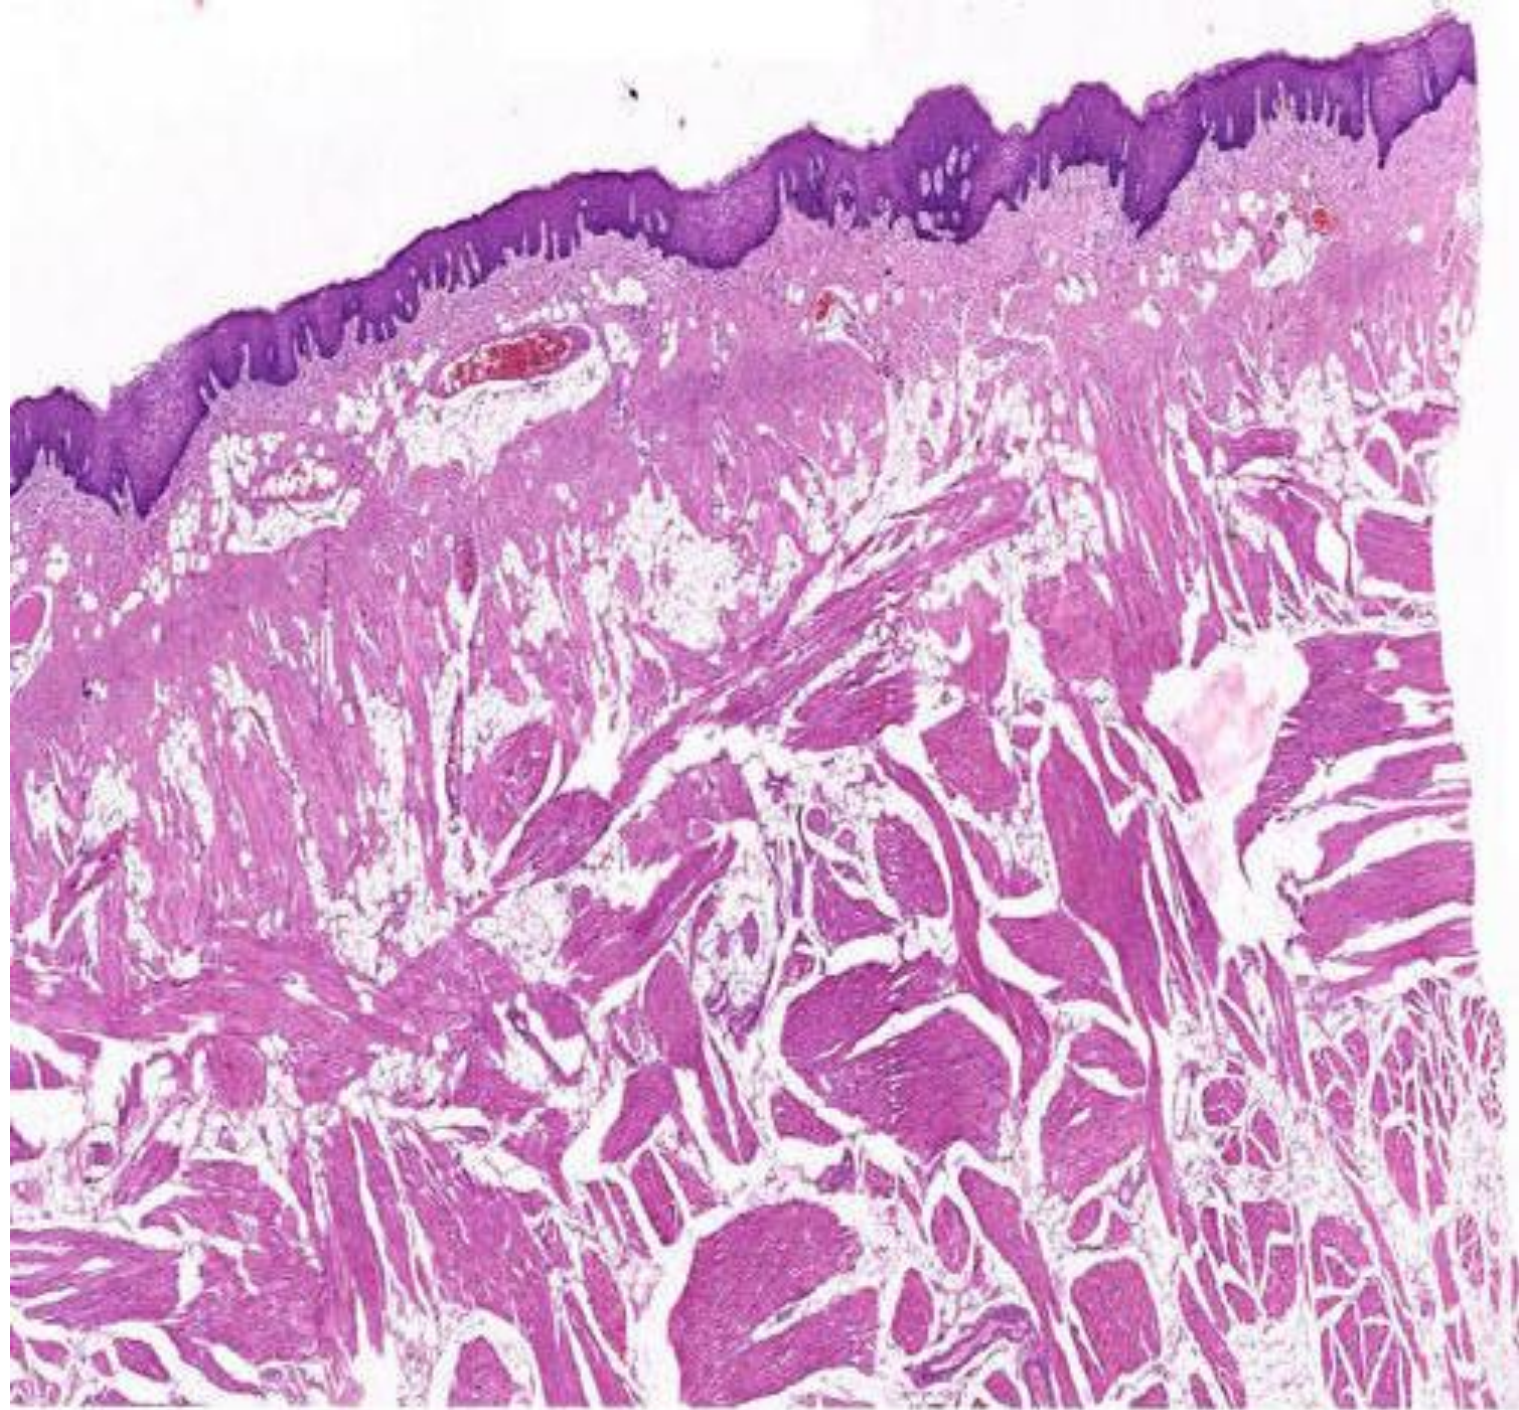

SLIDE DISCUSSION BUCCAL MUCOSA AND LIP

DR SAJDA GAJDHAR

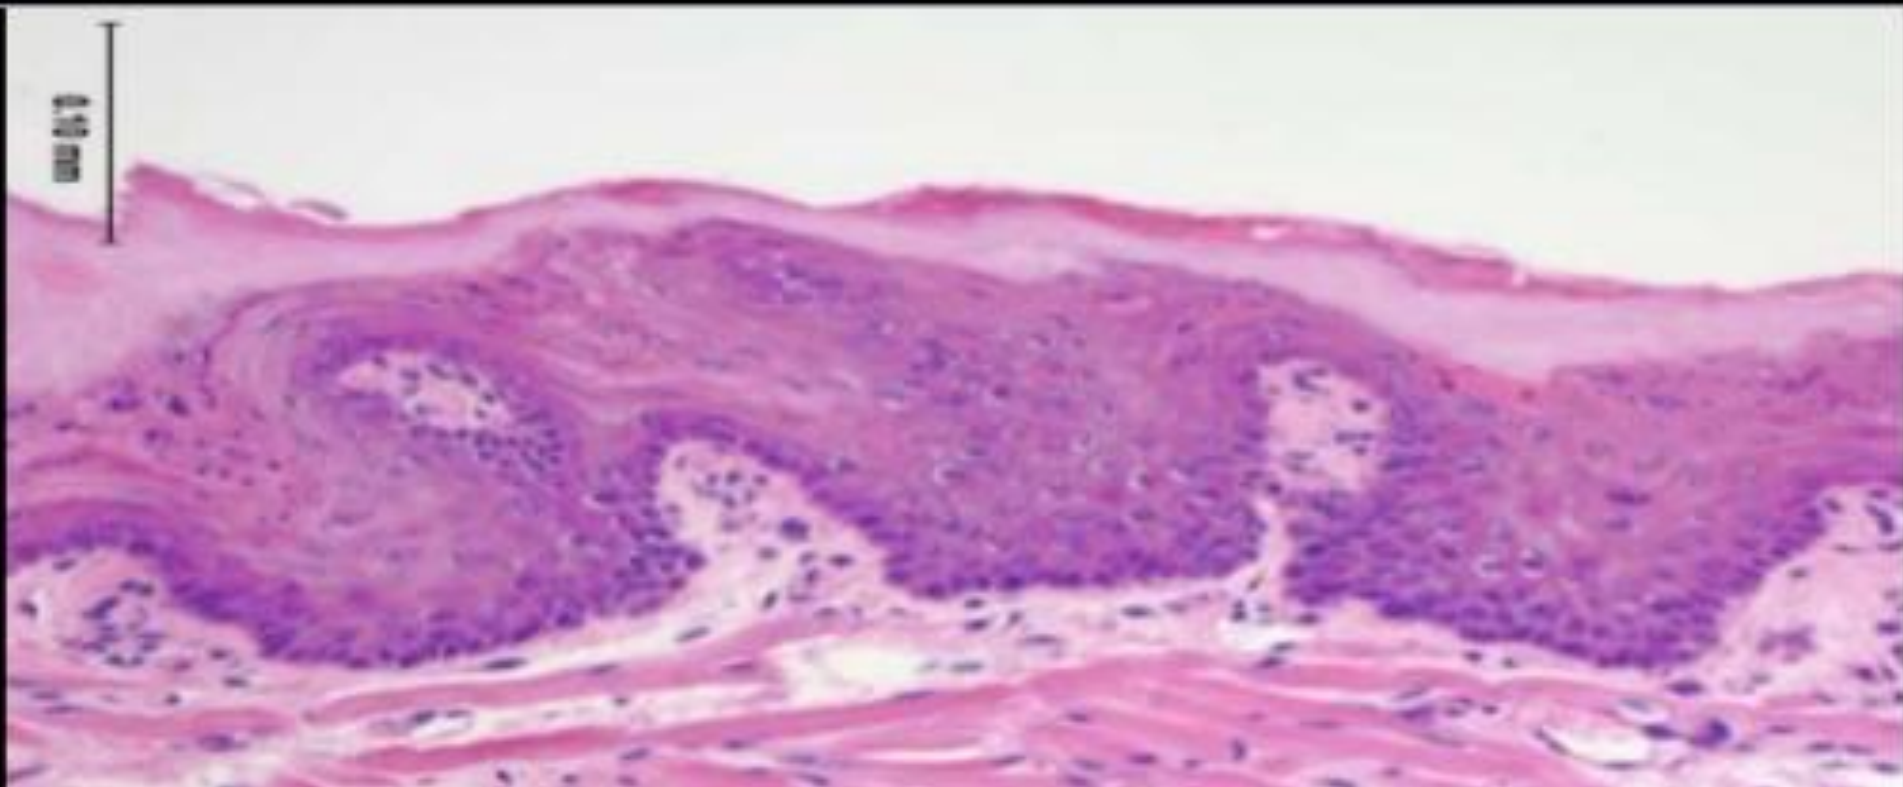

BUCCAL MUCOSA

Cheek

Submucosa contains fat cells and small mixed salivary glands

Oral epithelium

This histological section shows a portion of the oral cavity. On the left, a thick, multi-layered pink structure represents the oral epithelium. To the right, the connective tissue stroma contains numerous small, circular or oval structures, which are the minor salivary glands. These glands are composed of acini (secretory cells) and ducts. The overall tissue is stained with hematoxylin and eosin (H&E), giving it a pink and purple appearance.

Minor salivary glands

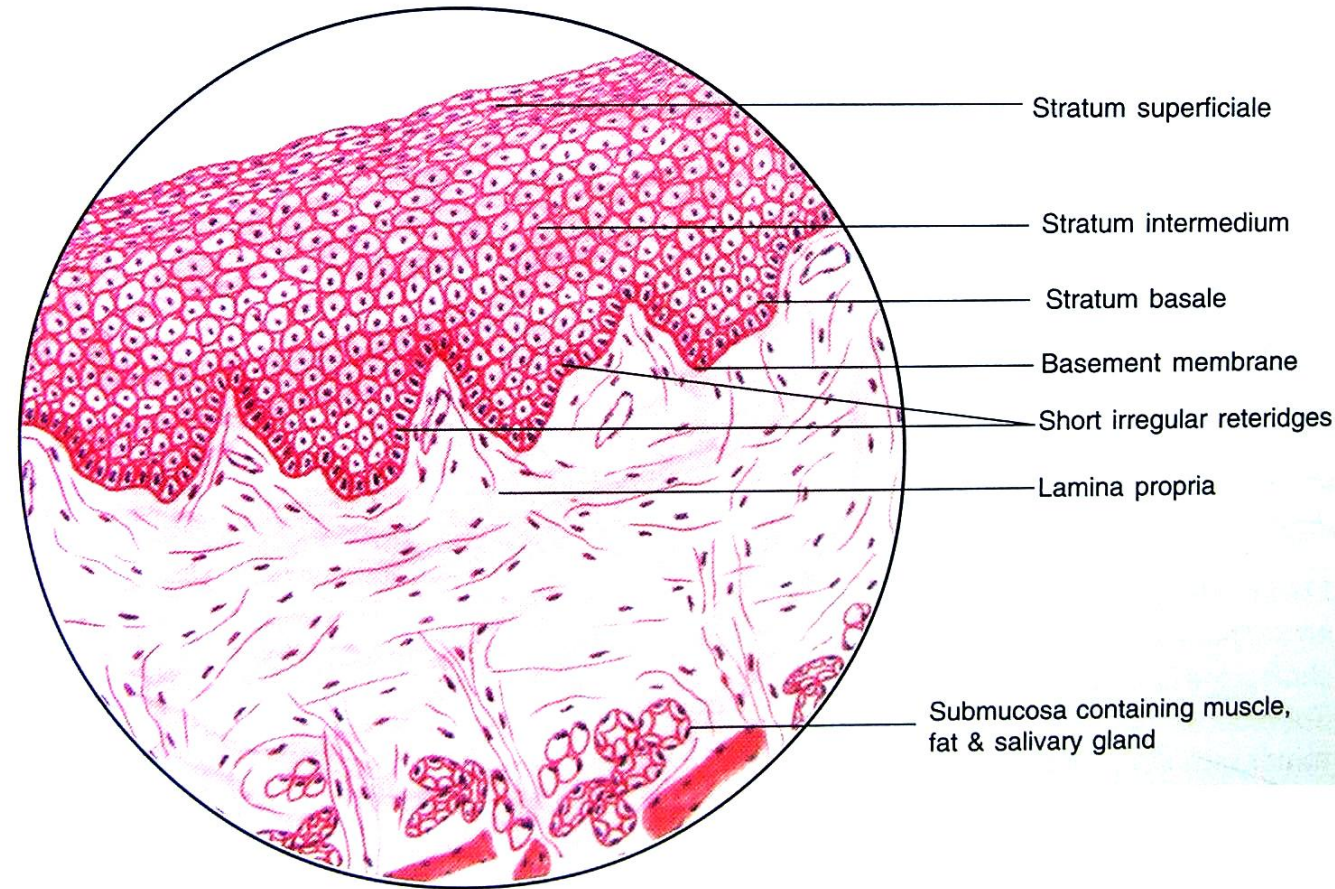

Histology of buccal mucosa

1. **Epithelium** : **Non** Keratinized stratified squamous epithelium with few short and blunt rete ridges
2. **Lamina Propria** : vascular
3. **Submucosa** : fat cells and minor salivary glands

Buccal Mucosa

LIP

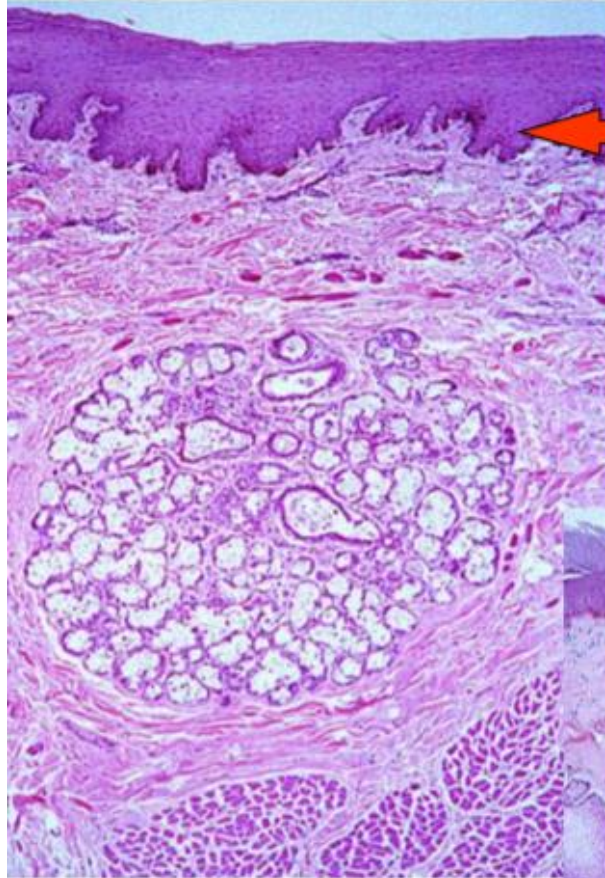

Vermilion zone of lip

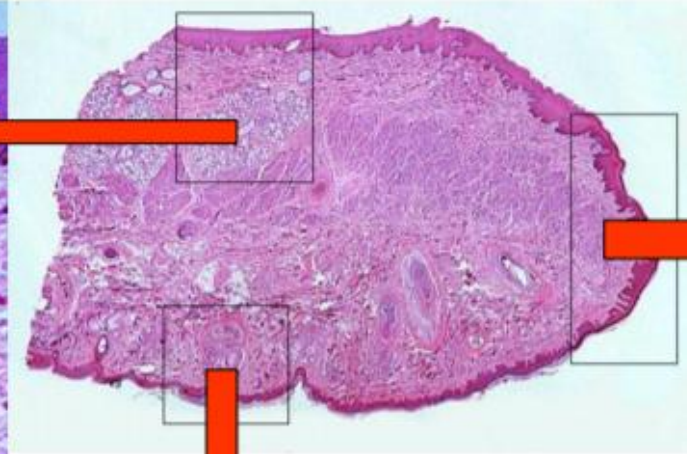

A. junction of the mucous membrane of the oral cavity
b. the skin of the lip
Skin is composed of the epidermis (epithelial layer) and the dermis (dense connective tissue layer). C. Labial Mucosa, is composed of epithelium and lamina propria.

Lip

**2-Mucous side
(Labial mucosa)**

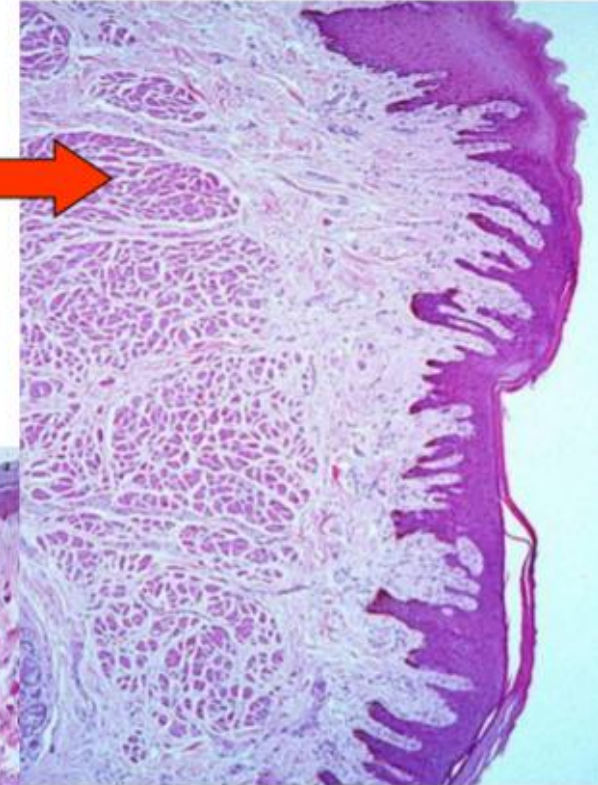

**Submucosa contain
fat cells & minor
mixed S.Gs**
